

BROADACRE / SOWING

Liquid inject

Put nutrition where the crop starts.

We use your soil test to calculate each nutrient requirement in kg/ha, then select from our standard products or make a **liquid prescription blend** for your paddock.

Proudly partnering with **Liquid Systems (SA)** to match our nutrient prescriptions with reliable liquid injection systems, helping put the right nutrition in the right place.

Learn more: liquidsystems.com.au.

WHY LIQUID INJECT

01

Feed early growth

Supply nitrogen and phosphorus to support the establishing crop.

02

Address calcium and sulphur needs

Place suitable products in the root zone where testing identifies a requirement.

03

Target trace-element shortfalls

Include the trace elements your crop needs in the sowing program.

Liquid injection at seeding adds flexibility and complements your granular program.

Placement makes the difference

Together, Hybrid Ag and Liquid Systems (SA) match the right system and nutrient placement to your soil, crop and products.

LIQUID SYSTEMS (SA) / PLACEMENT OPTIONS

Multiple liquids can be applied independently

Placement diagram supplied by Liquid Systems (SA).

Liquid injection enables precise nutrient placement across multiple soil horizons, matched to what the crop and product require. Options include in-furrow with the seed, side banding, deep banding and surface applications.

Liquid Systems (SA) can configure separate liquids with independent rate control in one pass for continuous, even flow across every row.

PRODUCTS TO CONSIDER IN THE PROGRAM

PAGE 03

Nitrogen for establishment

UAN
Liquid SOA

PAGE 04

Phosphorus and calcium

APP Liquid
Liqui-Cal

PAGE 05

Sulphur and trace elements

Liqui-Gyp
Opti-Trace Max

PAGE 06

Humic and seaweed inputs

Humix
Bio-Sea Black

Alongside these standard products, we can make liquid prescription blends to match your soil-test nutrient requirements. These options are not a combined tank mix. Confirm delivery paths, rates and compatibility. Suspensions and incompatible liquids may need a different setup.

Placement and seed separation must suit the product, crop, soil conditions and seeding system.

Nitrogen for establishment

Match liquid starter nitrogen and later applications to crop demand and the season to target better fertiliser returns.

UAN

UREA AMMONIUM NITRATE

UAN supplies nitrogen in urea, ammonium and nitrate forms. A starter application can support cereal establishment where nitrogen is limiting, with later nitrogen managed across the season.

WHERE IT FITS

Use it within the whole nitrogen budget. Band away from the seed; rate, row spacing, soil moisture and crop sensitivity all affect the risk of fertiliser damage.

1,000 L IBC

PROVIDES Nitrogen

BEST FIT Nitrogen-limited cereals

Liquid SOA

AMMONIUM SULPHATE LIQUID

Liquid SOA is an excellent source of available sulphur early in the season. Sulphur is critical for early metabolism of nitrogen in amino acid synthesis.

WHERE IT FITS

Best results in leachable alkaline sands with low trace element availability.

1,000 L IBC

PROVIDES Nitrogen + sulphur

BEST FIT Leachable alkaline sands

Set the product rate, water ratio and placement with your Hybrid Ag agronomist before sowing.

Phosphorus and calcium

Place phosphorus near developing roots and supply calcium where needed to support new growth.

APP Liquid

AMMONIUM POLYPHOSPHATE

APP Liquid supplies ammonium nitrogen and phosphorus. It gives the sowing program a liquid phosphorus option, placed where developing roots can reach it.

WHERE IT FITS

Use soil testing to set the phosphorus requirement. Keep calcium products out of the same mix unless compatibility has been established.

1,000 L IBC

PROVIDES Nitrogen + phosphorus

BEST FIT Phosphorus at sowing

Liqui-Cal

CALCIUM CARBONATE WITH HUMIX

Liqui-Cal supplies calcium in a fine calcium carbonate suspension with Humix. Calcium is needed for new root growth and cell-wall development.

WHERE IT FITS

Consider it where root-zone calcium is a priority. Any local pH-buffering role needs to be assessed against the soil test; low-volume placement does not replace the paddock's lime requirement.

1,000 L IBC

PROVIDES Calcium 15.8% w/v

BEST FIT Root-zone calcium needs

Set the product rate, water ratio and placement with your Hybrid Ag agronomist before sowing.

Sulphur and trace elements

Correct sulphur and trace element shortages that could be holding back crop growth.

Liqui-Gyp

GYPSUM WITH HUMIX

Liqui-Gyp supplies calcium and sulphur in a fine gypsum suspension with Humix. Gypsum provides sulphur as sulphate and does not act as a liming material.

WHERE IT FITS

An option where testing identifies a calcium or sulphur need, including low-sulphur sandy soils. Match the product to the nutrient requirement rather than soil texture alone.

1,000 L IBC

PROVIDES Calcium + sulphur

BEST FIT Low-sulphur sandy soils

Opti-Trace Max

A MULTI-TRACE OPTION

Addresses common trace element deficiencies including Mn, Zn, B and Cu, along with fulvic, carbon chelators, silicon and cobalt for biological stimulation in the root zone.

WHERE IT FITS

Match the choice to the diagnosed need and confirm compatibility with the sowing mix.

1,000 L IBC

PROVIDES Trace elements

BEST FIT Multiple trace-element shortfalls

Suspensions need a suitable system, which Liquid Systems (SA) can provide. Confirm agitation, filtration and outlet requirements before use.

Humic and seaweed inputs

Humic and seaweed inputs can support root growth and help crops make better use of sowing fertiliser.

Humix

HUMIC COMPOUNDS FOR THE ROOT ZONE

Humix is a liquid potassium humate that supplies humic compounds and organic carbon. It can be applied around developing roots alongside the sowing fertiliser program.

WHERE IT FITS

Liquid inject at **5 L/ha**. Check compatibility before mixing with fertiliser or other inputs.

1,000 L IBC

PROVIDES Humic compounds + organic carbon

BEST FIT Root-zone humic inputs

Bio-Sea Black

A SEAWEED OPTION AT ESTABLISHMENT

Bio-Sea Black supplies seaweed extract for use alongside mineral fertiliser during crop establishment.

WHERE IT FITS

Liquid inject at **2 L/ha**. Check compatibility before mixing with Humix or fertiliser.

1,000 L IBC

PROVIDES Seaweed extract

BEST FIT Crop establishment

Set the product rate, water ratio and placement with your Hybrid Ag agronomist before sowing.

Everything starts with a soil test

Understand the soil. Calculate the nutrient requirement. Build the program.

Cation exchange capacity and base saturation are the starting point for our recommendations. We read these alongside the full soil analysis, crop needs and existing inputs to calculate nutrient requirements per hectare.

Soil analysis

ANONYMISED EXAMPLE / 0-10 cm SAMPLE

CEC

4.12

TEC

5.38

PH (WATER)

5.90

ORGANIC CARBON

1.13%

Cation exchange capacity describes how well a soil can hold positively charged nutrients. Base saturation shows the balance of cations on those exchange sites.

Cation balance

Base saturation	Found	Report target
Calcium	50.00%	64%
Magnesium	11.52%	15%
Potassium	10.41%	4-7%
Sodium	1.49%	0.5-1.5%

Selected base-saturation results and targets from this example report.

Requirements per hectare

kg/ha of each element

Ca

Calcium

378

Mg

Magnesium

58

S

Sulphur

67

B

Boron

4

Zn

Zinc

16

Cu

Copper

10

These are the example report's total soil amendment requirements, rounded to whole kilograms. Product rates, timing and placement are planned separately.

From the soil result to the right product

We use the nutrient budget to select **standard products** or **formulate a liquid prescription blend**. The program separates longer-term soil correction from crop nutrition and identifies what is suitable for liquid injection at sowing.

Your paddock's results determine the recommendation.

Condensed example only. Report targets are specific to this example; these figures are not liquid-injection application rates.

Build the sowing program

Match the products and the setup to the nutrient requirement.

Once the nutrient requirement is clear, we select suitable products and decide what belongs at sowing, what needs a separate soil amendment and what should be applied later.

STANDARD PRODUCT OPTIONS

Paddock Priority	Products to Discuss
Early nitrogen	UAN or Liquid SOA
Phosphorus at sowing	APP Liquid
Calcium or sulphur need	Liqui-Cal or Liqui-Gyp; Liquid SOA for N + S
Several trace-element shortfalls	Opti-Trace Max
Humic or seaweed input	Humix or Bio-Sea Black

Legume inoculation. Liquid Systems (SA) can deliver crop-specific inoculants into the furrow to support nodulation. Always check the strain, water quality and compatibility before use.

Confirm the application rate, product:water ratio and separation from seed. Check physical compatibility using your water source, then calibrate the system and check each outlet. A jar test does not confirm seed or crop safety.

Include a comparison with your standard program and check establishment, root growth and harvest results.

MEET THE TEAM AT HENTY

22-24 September 2026

Sites 998-999, Block T

Bring your soil results. James White and Bruce Armstrong can work through the nutrient requirements and sowing setup with you.
